Python While Loops In Python, While Loops is used to execute a block of statements repeatedly until a given condition is satisfied. • And when the condition becomes false, the line immediately after the loop in the program is executed. • While loop falls under the category of indefinite iteration. • Indefinite iteration means that the number of times the loop is executed isn't specified explicitly in advance. Enter while loop False Test Expression True Statements Exit while loop DG # While Loops temp = 0while temp!=-1000: temp = eval(input('Enter a temperature (-1000 to quit): ')) print('In Fahrenheit that is', 9/5*temp+32) print('The loop is over now') Enter a temperature (-1000 to quit): 95 In Fahrenheit that is 203.0 Enter a temperature (-1000 to quit): 96 In Fahrenheit that is 204.8 Enter a temperature (-1000 to quit): 100 In Fahrenheit that is 212.0 Enter a temperature (-1000 to quit): -1000 In Fahrenheit that is -1768.0 The loop is over now In [2]: i = 0while i !=10: i+= 1 print(i) 2 3 4 5 6 7 8 10 In [3]: i = 0while i!=10: print(i) i+= 1 0 1 8 for i in range(10): print(i) 1 5 In [5]: temp = 0while temp!=-1000: temp = eval(input('Enter a temperature (-1000 to quit): ')) **if** temp!=-1000: print('In Fahrenheit that is', 9/5*temp+32) else: print('Bye!') It is like null operation, as nothing will happen is it is executed. • Pass statement can also be used for writing empty loops. · Pass is also used for empty control statement, function and classes. In [34]: # Pass Statements for letter in 'Python': if letter == 'h': pass print('This is pass block') print('Current Letter :', letter) print("Good bye!") Current Letter : P Current Letter : y Current Letter : t This is pass block Current Letter : h Current Letter : o Current Letter : n Good bye! Python | assert keyword · Assertions in any programming language are the debugging tools which help in smooth flow of code. • Assertions are mainly assumptions that a programmer knows always wants to be true and hence puts them in code so that failure of them doesn't allow the code to execute further. • In python assert keyword helps in achieving this task. • This statement simply takes input a boolean condition, which when returns true doesn't return anything, but if it is computed to be false, then it raises an AssertionError along with the optional message provided. In [37]: # Assert x = "hello"#if condition returns True, then nothing happens: assert x == "hello" #if condition returns False, AssertionError is raised: $\#assert \ x == "goodbye"$ In [39]: # x = "hello"# #if condition returns False, AssertionError is raised: # assert x == "goodbye", "X should be 'hello'" In [42]: x = input('Please enter the right string: ') guess = input('Please guess a right string: ') #if condition returns False, AssertionError is raised: **assert** $x == "goodbye", "X should be {}".format(x)$ Please enter the right string: gsaidheeraj Please guess a right string: gsaidheeraj Traceback (most recent call last) AssertionError <ipython-input-42-6e63fdda1b7d> in <module> 4 #if condition returns False, AssertionError is raised: ----> 5 assert x == "goodbye", "X should be {}".format(x) **AssertionError**: X should be gsaidheeraj Lamda Function • As we already know that def keyword is used to define the normal functions and the lambda keyword is used to create anonymous functions. It has the following syntax: lambda arguments: This function can have any number of arguments but only one expression, which is evaluated and returned. One is free to use lambda functions wherever function objects are required. You need to keep in your knowledge that lambda functions are syntactically restricted to a single expression. It has various uses in particular fields of programming besides other types of expressions in functions. Use of lambda() with filter() • The filter() function in Python takes in a function and a list as arguments. • This offers an elegant way to filter out all the elements of a sequence "sequence", for which the function returns True. Use of lambda() with map() • The map() function in Python takes in a function and a list as argument. • The function is called with a lambda function and a list and a new list is returned which contains all the lambda modified items returned by that function for each item. Use of lambda() with reduce() • The reduce() function in Python takes in a function and a list as argument. • The function is called with a lambda function and a list and a new reduced result is returned. • This performs a repetitive operation over the pairs of the list. In [43]: # Lambda Function adder = lambda x, y: x + y print (adder (1, 2)) 3 In [44]: x = lambda x, y : x + yprint(x(5,10))15 In [45]: x =**lambda** a, b, c : a + b + c print(x(5, 6, 2))13 In [46]: (lambda x: x + 1)(2)Out[46]: 3 In [47]: def myfunc(n): return lambda a : a * n In [48]: def myfunc(n): return lambda a : a * n mydoubler = myfunc(2) print(mydoubler(22)) 44 In [49]: def myfunc(n): return lambda a : a * n mydoubler = myfunc(2) mytripler = myfunc(3) print(mydoubler(11)) print(mytripler(11)) 22 33 In [50]: # Lambda with a Filter sequences = [10, 2, 8, 7, 5, 4, 3, 11, 0, 1]filtered_result = filter (lambda x: x > 4, sequences) print(list(filtered_result)) [10, 8, 7, 5, 11] In [51]: $my_list = [1, 5, 4, 6, 8, 11, 3, 12]$ $new_list = list(filter(lambda x: (x%2 == 0), my_list))$ print(new_list) [4, 6, 8, 12] In [56]: sequences = 10,15 filtered_result = (lambda x: x*x) #(sequences) print(tuple(filtered_result)) **TypeError** Traceback (most recent call last) <ipython-input-56-4598b7cf4b5a> in <module> 1 sequences = **10**, **15** 2 filtered_result = (lambda x: x*x) #(sequences) ----> 3 print(tuple(filtered_result)) TypeError: 'function' object is not iterable In [57]: # lambdas in map() sequences = [10, 2, 8, 7, 5, 4, 3, 11, 0, 1]filtered_result = map (lambda x: x*x, sequences) print(list(filtered_result)) [100, 4, 64, 49, 25, 16, 9, 121, 0, 1] In [58]: # Python code to illustrate # reduce() with lambda() # to get sum of a list from functools import reduce li = [5, 8, 10, 20, 50, 100] sum = reduce((lambda x, y: x + y), li)print (sum) **Python Modules** • A module is a file containing Python definitions and statements. • A module can define functions, classes and variables. A module can also include runnable code. Grouping related code into a module makes the code easier to understand and use. import sys sys.version Out[63]: '3.6.12 | Anaconda, Inc. | (default, Sep 9 2020, 00:29:25) [MSC v.1916 64 bit (AMD64)]' In [64]: sys.path $\label{thm:conda3} $$ \operatorname{C:\Users\saidh\miniconda3\envs\tensorflow\python36.zip', 'C:\Users\saidh\miniconda3\envs\tensorflow\DLLs', $$ $$ $$$ 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow\\lib', 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow', 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow\\lib\\site-packages', 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow\\lib\\site-packages\\win32', 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow\\lib\\site-packages\\win32\\lib', 'C:\\Users\\saidh\\miniconda3\\envs\\tensorflow\\lib\\site-packages\\IPython\\extensions', 'C:\\Users\\saidh\\.ipython'] In [65]: import math math.pi 3.141592653589793 In [66]: math.e Out[66]: 2.718281828459045 In [67]: math.radians(30) 0.5235987755982988 In [68]: math.degrees(math.pi/6) 29.9999999999996 In [69]: math.sin(0.5235987755982988) 0.4999999999999994In [70]: math.cos(0.5235987755982988) 0.8660254037844387 In [71]: math.log(10) 2.302585092994046 In [72]: math.log10(10) Out[72]: 1.0 In [73]: math.exp(10) 22026.465794806718 In [74]: math.e**10 22026.465794806703 In [75]: math.pow(2,4)Out[75]: 16.0 In [76]: math.sqrt(100) Out[76]: 10.0 In [77]: math.ceil(4.5867) Out[77]: 5 In [78]: math.floor(4.5687) Out[78]: 4 In [79]: import statistics statistics.mean([2,5,6,9])Out[79]: 5.5 In [80]: statistics.median([1,2,3,8,9])Out[80]: 3 statistics.mode([2,5,3,2,8,3,9,4,2,5,6]) Out[81]: 2 In [82]: statistics.stdev([1,1.5,2,2.5,3,3.5,4,4.5,5]) Out[82]: 1.3693063937629153 In []:
